

With 100% No Touch Protection,
whatever you touch
won't touch VaPro catheters.

VaPro™
No Touch Intermittent Catheter

 **Hollister.**

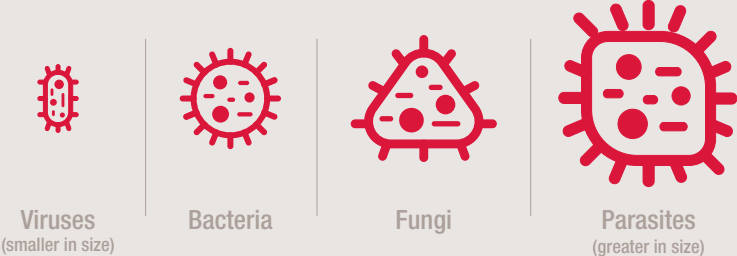

Continence Care

Proven to prevent the transmission of pathogens that may cause UTIs

The American Society for Testing and Materials (ASTM) is an international standards organisation that develops and publishes voluntary consensus technical standards for a wide range of materials. ASTM has also conducted and published approximately 6000 test methods to date.

ASTM F1671 is a pass or fail test designed to determine if protective materials prevent the transmission of blood-borne pathogens.

VaPro catheter sleeve material was tested. In the test, one side of the sleeve material was exposed to a solution containing a type of virus called bacteriophage. Results showed that the viruses did not pass through the sleeve material.

The VaPro catheter sleeve material passes the ASTM F1671 test, providing assurance that it protects against pathogens that may cause UTIs.

Go to Hollister.com.au or Hollister.co.nz to learn more about clinical and laboratory evidence that demonstrates the benefits of VaPro catheters' protective tip and sleeve.

An independent laboratory investigated the protective effects of VaPro™ catheters and how they compare with intermittent catheters from other manufacturers.

VaPro catheters provide 100% No Touch Protection with a protective tip and sleeve

VaPro catheters are hygienic by design to help protect you from germs throughout the entire catheterisation process.

Protective tip

- helps shield the sterile catheter during insertion from bacteria located within the first 15 mm of the distal urethra
- helps reduce the risk of carrying bacteria into the urinary tract

Protective sleeve

- allows for catheter to be gripped anywhere
- provides a barrier to the catheter to help keep germs away

The protective tip is designed for male and female use

The protective tip works to greatly reduce the risk of bacteria being carried into the urinary tract during the insertion process. This illustration demonstrates its effectiveness using the male anatomy.

The catheter is advanced into the protective tip, and then the protective tip is inserted into the urethra.

The protective tip helps prevent the catheter from coming into contact with the bacteria that are predominantly in the first 15 mm of the urethra.

The protective tip helps protect the catheter from becoming contaminated.

Watch the Contamination and Prevention in IC Treatment Video and learn more about Hollister tip & sleeve protection and how they are designed to help protect you from germs. Scan the QR code or visit our website

A recent study confirms high patient satisfaction

Study explored real-world preferences associated with using VaPro catheters

25 participants from 5 countries (UK, Germany, France, the Netherlands, and the US) were interviewed to assess the perceived advantages of VaPro catheters compared to other intermittent catheters.

All interviewees had experiences with competitive intermittent catheters and changed to VaPro catheters.

Participants reported a high level of **satisfaction** with VaPro catheters enabling them to overcome issues they had encountered with other intermittent catheters.

Some participants reported that VaPro catheters had a **positive** effect on their quality of life.

Participants find VaPro catheters to be **hygienic** and **easy** to use.

50% of participants reported **less** frequent UTIs after changing to VaPro catheters.
